

Building a repeatable insurance growth engine

Vilol Joshi

Insurance Product Lead conversation
September 2026

An outside-in product operating thesis for lute

HYPOTHESIS Public-information-based working hypotheses only. Internal customer evidence, carrier economics, regulatory constraints and operating data would determine actual prioritisation.

Strategic read The advantage is reducing the cost and uncertainty of launching the next successful product.

FACT Insurance intermediation represented 5% of Group revenue in 2025; lute also reported fully digital MTPL in Albania and preparation of a subscription proposition combining travel, life and roadside assistance. [1]	FACT In 6M 2026, insurance brokerage revenue grew 59.6% year on year to 5.7% of total revenue; standalone motor and health products were targeted for later in 2026. [2]	FACT lute Affinity publicly describes full-lifecycle administration, claims handling, partner coordination and multi-market standardisation as part of its role. [3]
--	---	---

Product Lead operating loop The role joins commercial decisions to operating outcomes.

Insurance Product Lead Customer · carrier · country · technology · compliance · operations · finance · marketing	01 Discover opportunity	02 Validate need	03 Shape proposition	04 Validate partner + economics
	05 Design journey + operations	06 Launch	07 Measure behaviour	08 Scale, iterate or stop

Product viability A viable product must work for three parties.

Customer Is the protection useful, understandable and dependable when needed? Premium · comprehension · coverage utility · service · renewal willingness	lute Does distribution create sustainable contribution and relationship value? Revenue · acquisition · service · payment · operations · persistency	Carrier / partner Can the portfolio be priced, underwritten and operated sustainably? Adequacy · claims · fraud · expense · capacity · service quality
Viable product A proposition that works for only two of the three parties eventually breaks.		

The product extends beyond checkout

Front stage simplicity depends on backstage discipline.

Complete lifecycle Design the policy, service, claim and renewal—not only the sale.

Front stage What the customer sees	Relevant offer	Legible cover	Confirmed policy	One place for help
Back stage What must work	Mylute	Orchestration + Affinity	Carrier + payments	Ops + claims + finance

Critical state

Payment authorised → bind fails → pending state → idempotent retry → policy or refund
Never leave the customer believing they are insured when issuance is unresolved.

Decision technology
Use the simplest reliable mechanism.

Answer defined? Rules / software	Prediction required? Predictive ML
Unstructured content? GenAI, grounded	High consequence or ambiguity? Human control

The consequence of error—not confidence alone—determines automation.

What success means
Connect system health to economic outcome.

System reliability	↓	Operational flow	↓	Customer experience	↓	Contribution + renewal
Commercial		Customer		Economics		Operations

Capability fit Patterns I can contribute—and the insurance depth I want to build with lute.

Transferable operating patterns

575K+
monthly regulated cases
Document intelligence · confidence routing · human review · evaluation · governance

~45%
manual-review reduction

~25%
API turnaround improvement

Learning with lute

Carrier economics and contracting

Country-specific customer and regulatory reality

Claims, servicing and Affinity operating depth

The product patterns lute has already proved at scale

These are transferable patterns from regulated financial workflows—not a claim that insurance is identical to KYC or lending.

HYPOTHESIS

These are outside-in hypotheses rather than recommendations. I'm looking forward to understanding where they align—or conflict—with what the team is seeing internally.
